

Building hybrid HTML5 apps with Phonegap the easier way*

*there is no easy way

The problem: too many platforms

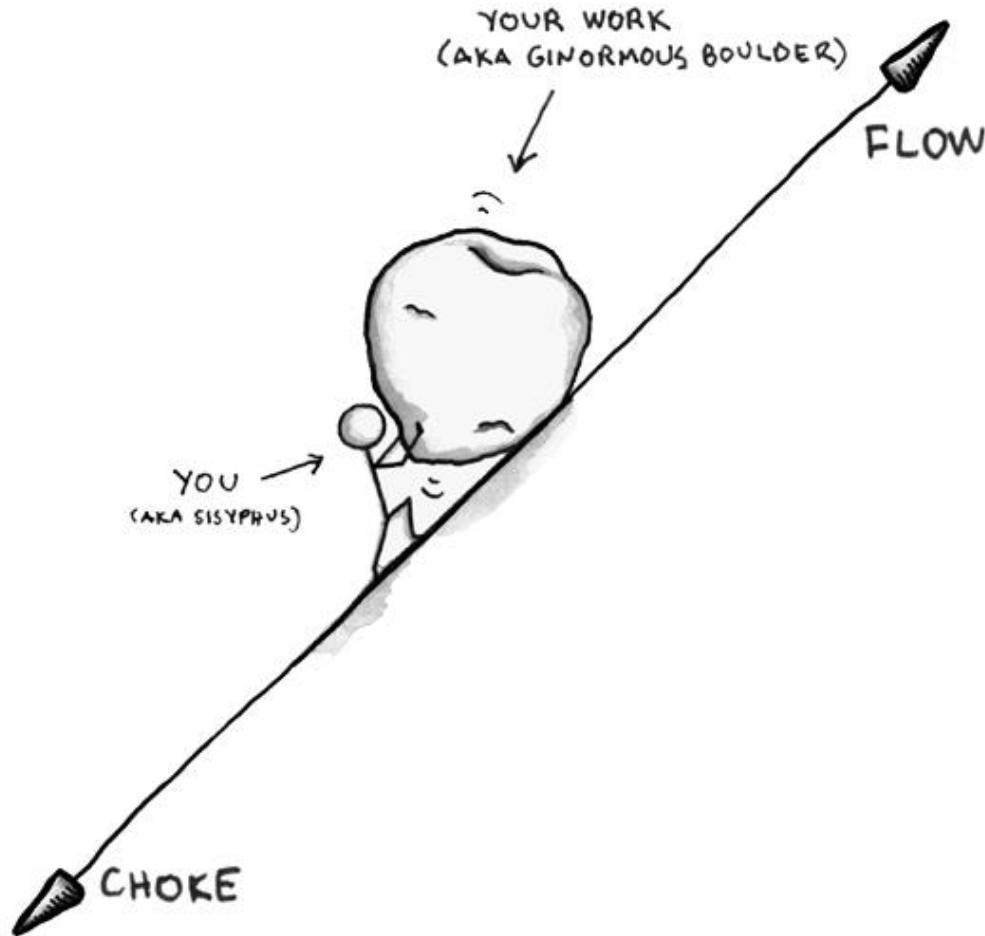

We tried doing it the old way

- ▶ Building a new/separate API
- ▶ Building native Android apps
- ▶ Building native iOS apps
- ▶ Building HTML5 browser apps
- ▶ Supporting them all...

What have we learned?

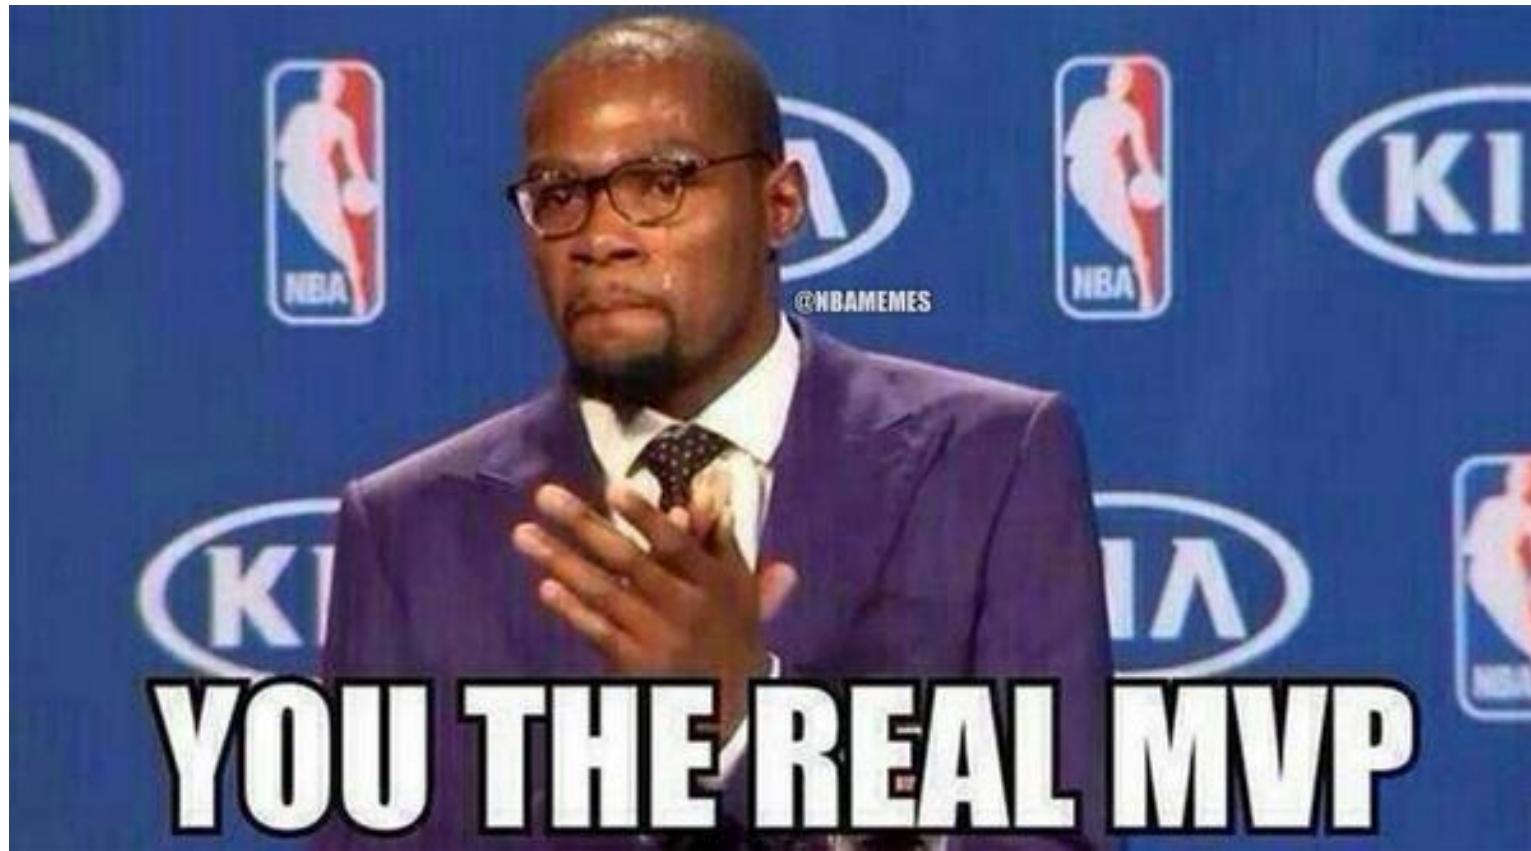

Slow & Expensive

So, where should I start?

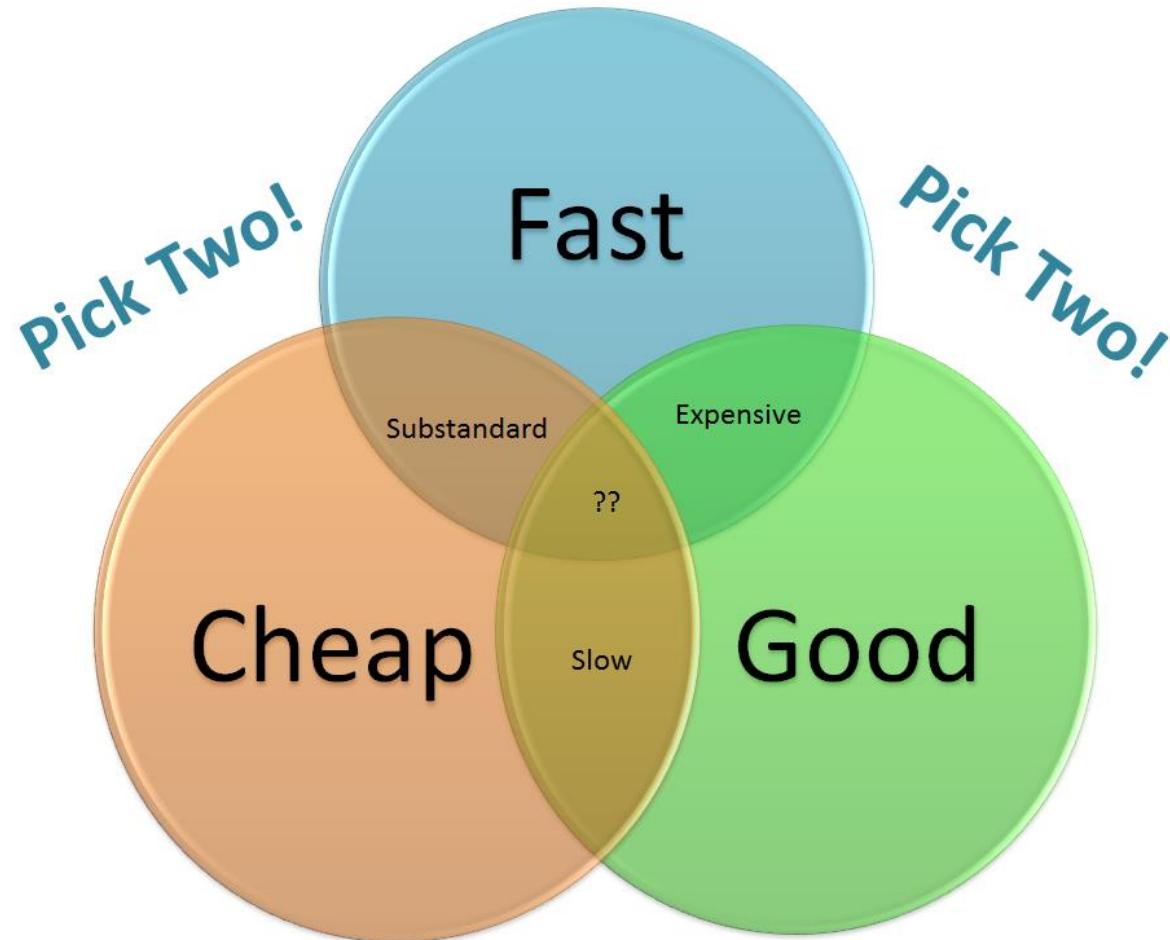

Your Mobile Site = Most Valuable Platform

Why?

- ▶ Soon: the majority of your traffic(already?)
- ▶ Free distribution: SEO
- ▶ Best conversion channel for your “native” apps(splash screens, smart app banners, etc)

“Perfect is the enemy of Good”

The alternative: Phonegap

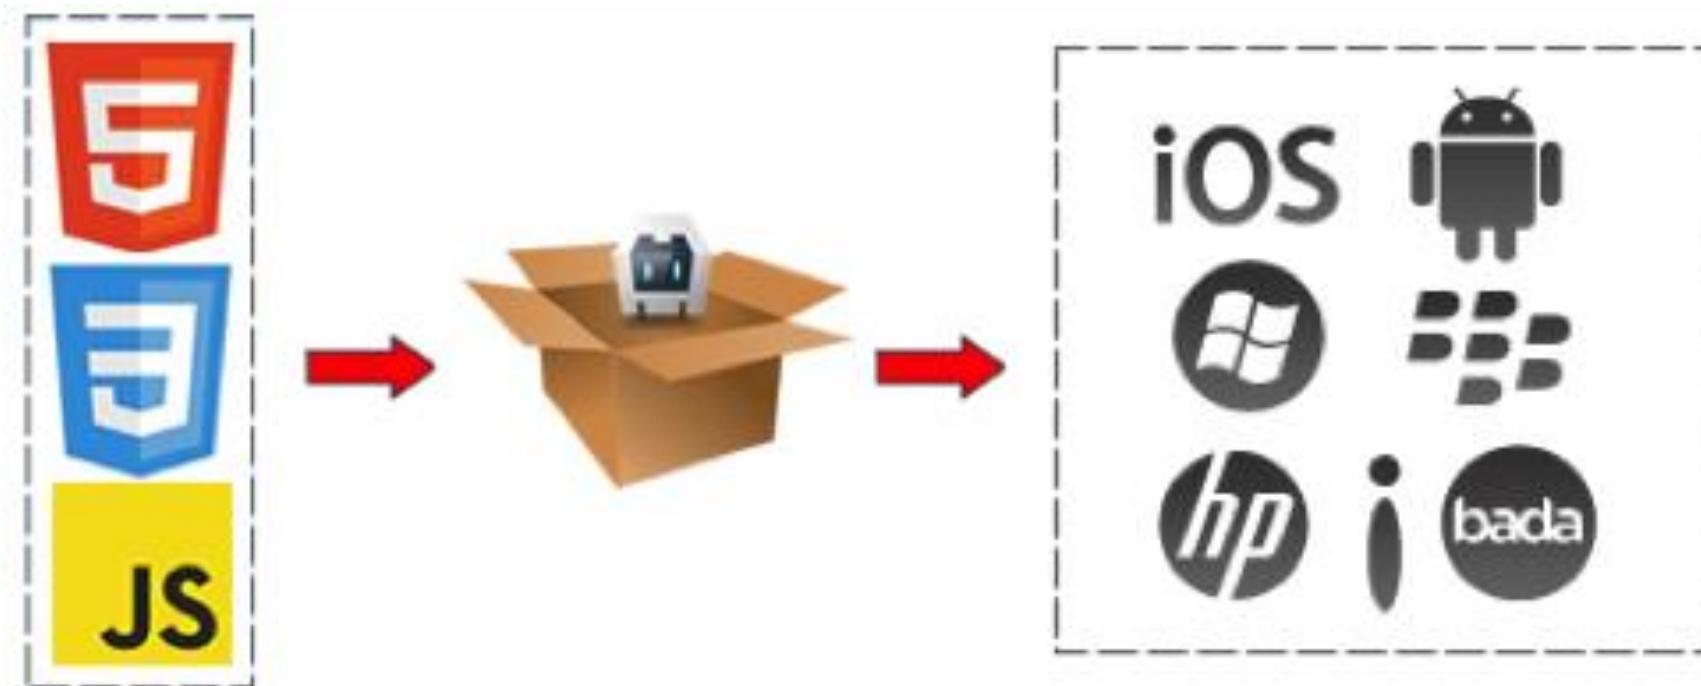

PhoneGap Mobile App Development

What is Phonegap?

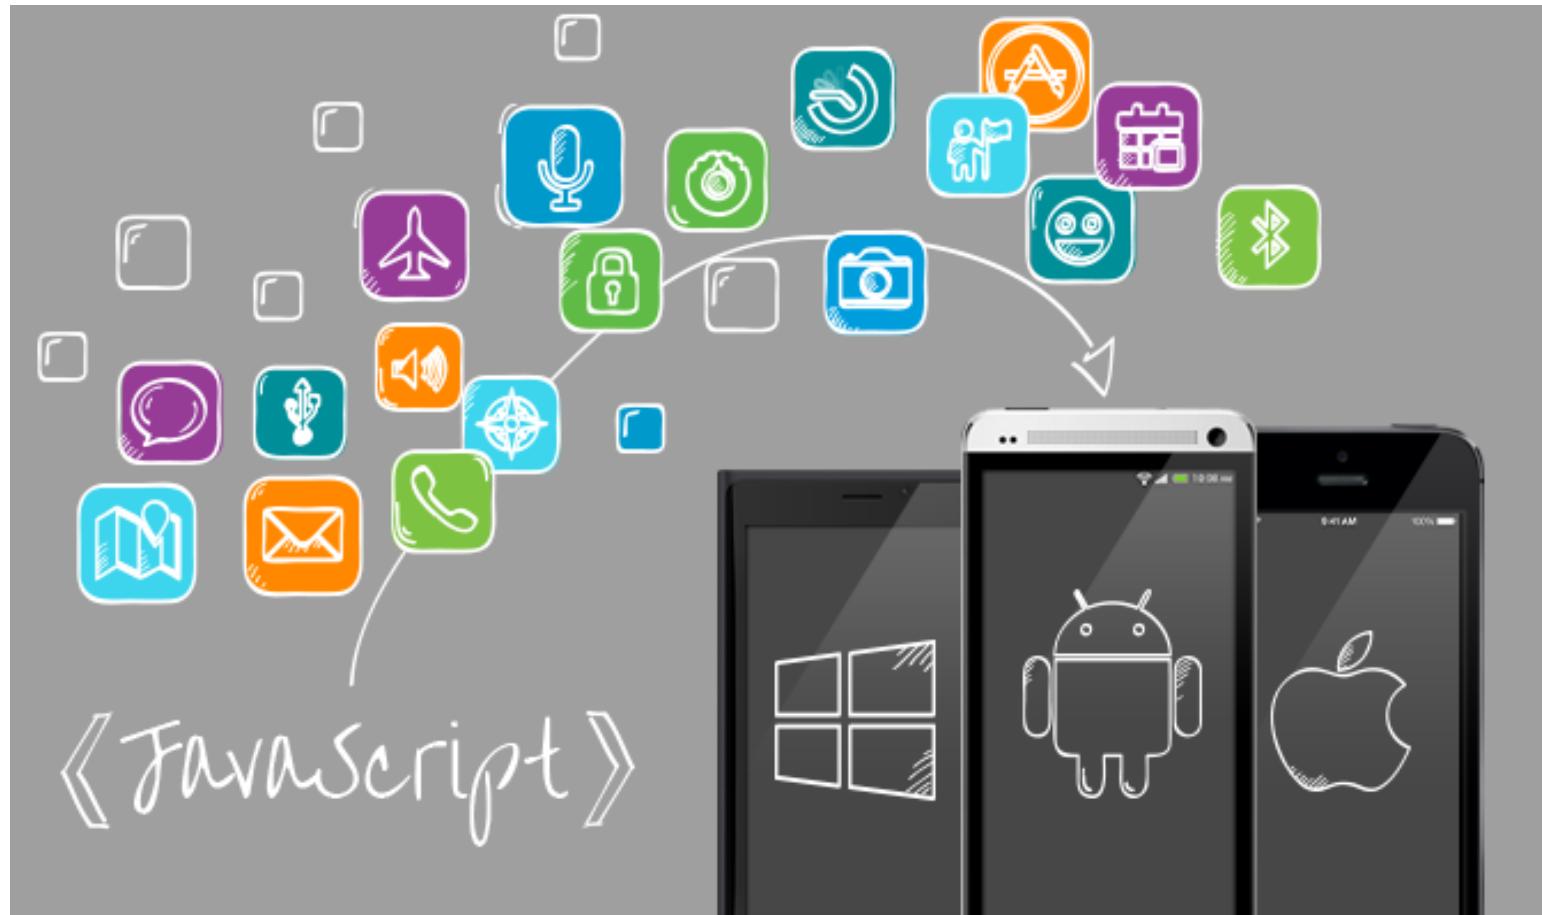

- ▶ **PhoneGap** is a free and open source framework that allows you to create mobile apps using standardized web APIs for the platforms you care about.

*Phonegap is owned by Adobe and is based on open source Apache Cordova.

Apps can be developed with HTML, CSS, and JavaScript

Acces device APIs: Geo, Push, etc.

Phonegap app=HTML5 on steroids

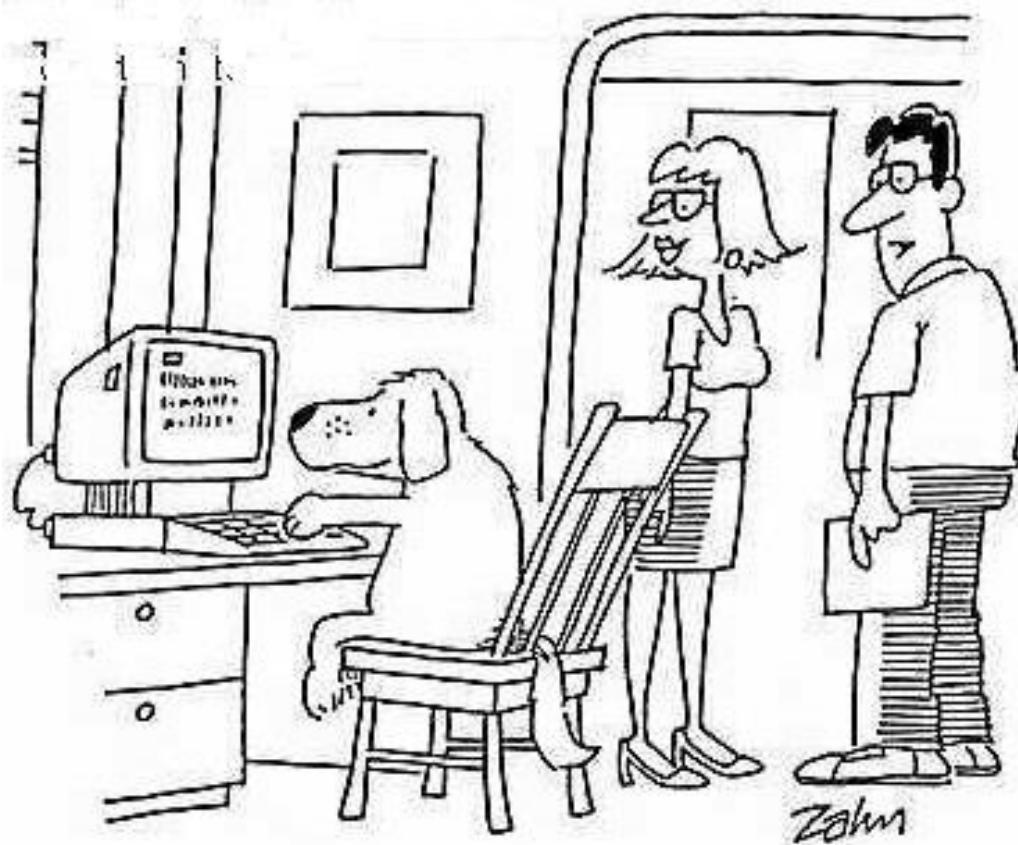

Drawbacks

- ▶ Slower performance than native code, especially if your app is graphically intense, i.e. a game.
- ▶ There is a learning curve
- ▶ Documentation not always great

how
to
start

Your web devs are your app devs

"I was wrong...you can teach
an old dog new tricks."

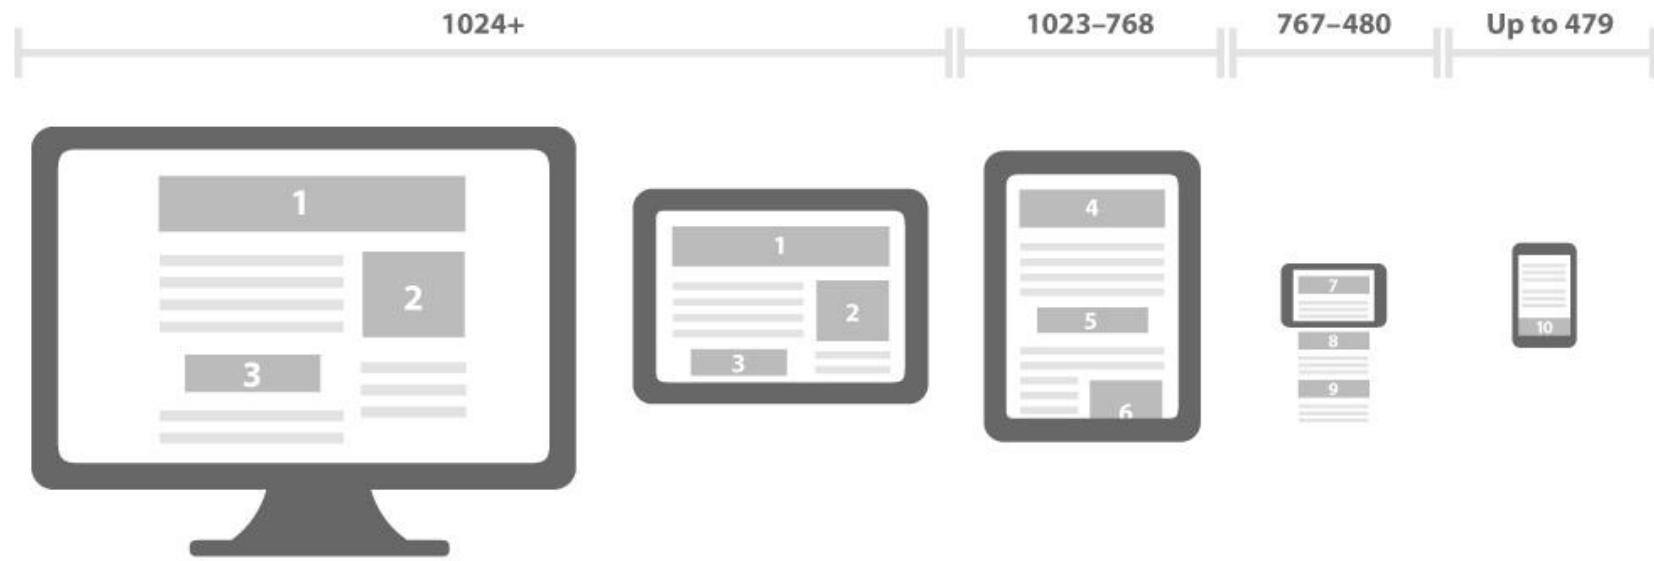

One API to drive them all

One UI

CONSISTENCY
IS 

Merge mobi and desktop sites

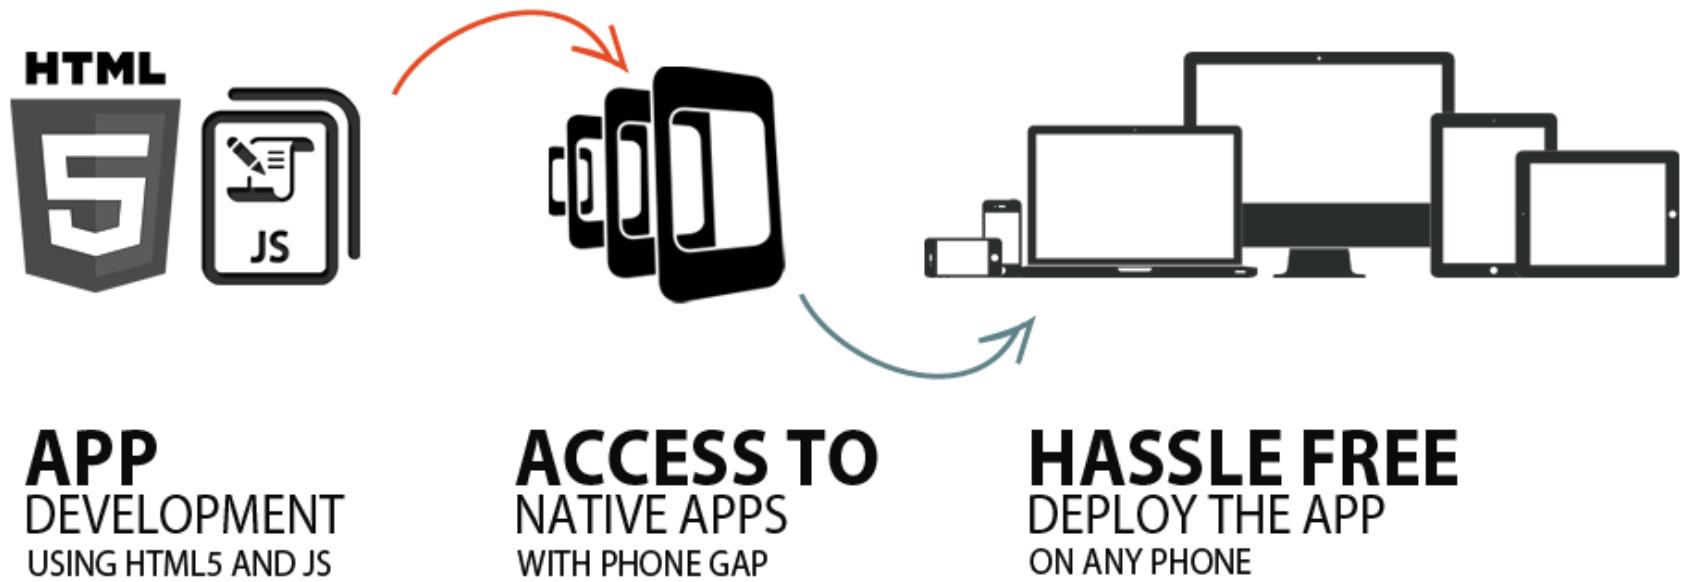

Use HTML5 UI frameworks: Kendo, Ionic, Sencha, etc.

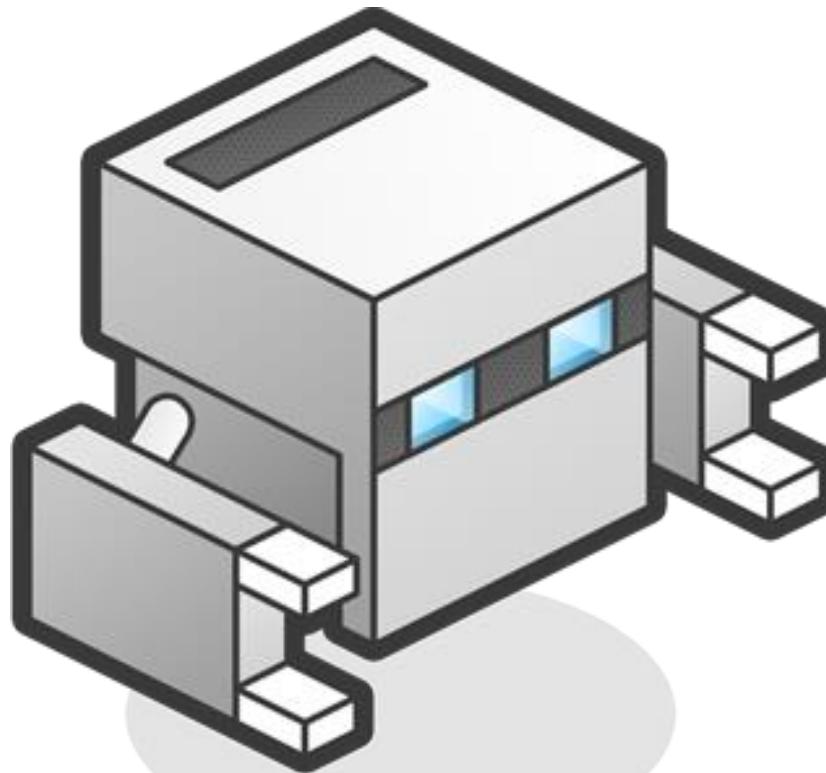

Or, build your own UI!

What is the the process?

Phonegap build: package apps in the cloud

PhoneGap:Build

Write once. Compile in the cloud. Run anywhere.

Thank you!
